Introduction
I'm creative, curious, and thorough. There's always more to learn and I want to learn it. Security, to me, is a very enjoyable field and I bring with me enthusiasm for security as art, science, work, and play.

Education
- Bachelor's Degree in Computer Science, Eastern Washington University – 2022
- Minor in Cybersecurity, Eastern Washington University – 2022
- Associate's Degree in Network Design, Spokane Community College – 2019

Experience
- Security Consultant II at NetSPI – 09/30/2022 to 01/26/2026
- Security Engineer at Intrinium and TorchLight – 2022
- Open-source web forum development for CiviWiki – 2018
- Freelance web scraper and bot development – 2017 to 2018
- Freelance Android app development in React Native – 2017 to 2018

At NetSPI, I conducted penetration tests against web applications and various kinds of LLMs (chatbots, RAG, tool-augmented, etc.). During my time there, I accomplished the following:
- Discovered critical authenticated and unauthenticated vulnerabilities in the public and private-facing websites of some of the largest banks in world, including SQL injections, IDORs, and MFLACs.
- Discovered a race condition/authentication bypass that allowed an attacker to take over any home security device across a nationwide network.
- Developed a stealthy and persistent exploit chain to exfiltrate sensitive internal bank documents using a combination of indirect prompt injection and markdown injection.
- Found a wide range of high-severity vulnerabilities in Fortune 500 tech, finance, energy, and healthcare companies, as well as tests for IoT manufacturers and government contractors.
- Developed various internal and open-source security tools for network, web, and AI testing.

Please feel free to email me with any questions you might have.
I can provide more details without naming specific clients.

Bug Bounty
I'm currently doing bug bounties on HackerOne.
So far, none of the companies I've worked with have given me permission to post redacted bug reports on my website, but any I do have permission to publish will eventually be found there.
If you'd like do know about the bugs I've found or my overall testing process, I can certainly provide general information.

Tools
Some of the more interesting tools I've created are:

- **RON** – RATs of Nim, a multi-agent C2 framework using Urwid, Nim, and websockets.
- **Blink** – Bringer of Links, a web content and subdomain locator based entirely on DuckDuckGo search results. Uses Splinter + search operators to achieve 100% OSINT-powered scanning.
- **LORE** – Locator of Recorded Exploits, a tool for quickly and easily locating the relevant info from HackTricks, GTFOBins, and LOLBAS Project.
- **Doc** – A CTF/pentest documentation tool. Organizes target info into JSON-based cards that can be searched and used to store or provide data for other tools.
- **Wopper** – A tool for automatically uploading and executing self-destructing webshells to WordPress targets once you have admin credentials.

  NetSPI blog post for Wopper:
  https://www.netspi.com/blog/technical-blog/web-application-pentesting/getting-shells-at-terminal-velocity-with-wopper

Certifications

- INE eWPT – 09/2024
- Cisco CCNA – 10/2019
- Cisco CCNA Routing & Switching – 10/2019
- CompTIA Linux+ – 12/2018
- Microsoft Technology Associate: Security Fundamentals – 5/2015
- Microsoft Technology Associate: Networking Fundamentals – 5/2015

I plan to take the OSCP exam as soon as possible.

Awards

- 2nd Place - Spokane Mayor's Cup Cybersecurity Competition – 2022
- 2nd Place - Spokane Mayor's Cup Cybersecurity Competition – 2019
- 3rd Place - Network Design, Future Business Leaders of America nationals
- 6th Place - Cybersecurity, Future Business Leaders of America nationals
